ABSTRACT

A pilot survey was conducted of employers of 300 former students trained in preparatory career education programs in Iowa. The completed questionnaires were analyzed by education program, school, and merged area. The data from the survey indicated that employers were generally pleased with the abilities of the employees when first hired. Over two-thirds of the employees were evaluated to have "very good" or "good" job skills and technical knowledge; however, the employers indicated that they would like these employees to have had more technical training. In addition, the data revealed that employers were generally satisfied with the quality and quantity of the employees wcrk. Job skills, technical knowledge, work attendance, punctuality, and compliance were perceived to be satisfactory. Employers showed concern with the employees' willingness to accept responsibility and their need for supervision. The great majority of employees were perceived to be cooperative with both co-workers and management. (A major portion of this document contains statistical talles and the measurement instrument with related correspondence.) (BB)

I. INTRODUCTION

A. Background

In the past, very little information has been available from employers regarding the background and job performance of former students of preparatory career education programs in the technical high schools and community colleges in Iowa. This type of information could provide valuable help in revising and updating the career programs available to students.

In order to gather this needed information, the Iowa Department of Public Instruction contracted with The American College Testing Program in the Fall of 1976 to assist with the development, printing, administration, analysis, and reporting of the results for a pilot survey project. The purpose of the pilot survey was to determine if employer evaluations could be collected and analyzed in a meaningful way. Dr. Ken Wold, Chief of Support Services for the Iowa Department of Public Instruction, was appointed to coordinate the survey.

B. Procedures

In order to determine content and wording of the final instrument to be used in the pilot survey, ACT administered a preliminary version of the questionnaire to ten employers of Spring 1974 graduates of Kirk-wood Community College. This questionnaire was designed to collect information regarding the training of the employee, as well as the employee's current performance. Data collected from this tryout administration were used to draft the final version of the questionnaire during December, 1976.

Working in consultation with officials from ACT, Dr. Wold and his staff finalized the format of the survey instrument. ACT then designed and printed the pilot survey instruments. Special effort was made to design the questionnaire to protect the confidentiality of the information regarding employees. A copy of the questionnaire appears in Appendix A.

The pilot survey was administered to a selected sample, developed by the Department of Public Instruction, of employers of former students of career education programs from Merged Areas IV, V, and XI. This sample was 229 employers representing 300 former preparatory career students who had left school in the Spring of 1974 and who had identified their employers as of the Spring of 1975.

ACT hired and trained experienced interviewers to administer the questionnaire to the employers. The actual survey administration took place between January 20, 1977, and March 10, 1977.

Of the 300 potential surveys, information for 252 former students was actually provided by employers. Reasons for noncompletion of the remaining 48 survey forms were as follows:

•		,
Reason	Frequency	Percent
Employer out of business and/or cannot locate responsible person	16 ,	33.3
No record of employee having worked for employer	11	22.9
No current staff who can evaluate employee	10	20.8
Would not grant interview	,2	4.2
Miscellaneous Problems	9	18.8
• 1	. 48	100.0

-3-

Overall, the response rate of 84% is considered to be adequate for this pilot study. The employers, in general, were not reluctant to provide confidential information requested. Of course, the interviewers employed by ACT gave assurance that data for individual students would not be released.

The individual questionnaires were analyzed by ACT staff according to type of educational program of the employee, the institution at which the employee received training, and the merged educational area in which the employee received training. A copy of the responses to each item according to the above dimensions was mailed to the State Department in, the middle of March 1977.

II. ~RESULTS

A. Present Status With Firm

Employers were asked to identify the present employment status of the former students included in this pilot survey. These results are shown in Table 1. In general, only 4.8% of the employees had been discharged, but a rather large percentage (42.9%) had left their original employer voluntarily. The programs in which the greatest job stability had occurred were Agriculture and Office Occupations.

B. Characteristics of Employees When First Hired

It is important that the State Department has information related to the preparation students receive in career education programs.

Section C of the survey questionnaire was designed to collect such information. The first question (Item 1) asked employers for reactions, to the job skills possessed by employees when first hired.

The responses to this question, shown in Table 2, reveal that about 69% of the employees in the sample had at least "good" skills in the areas of producing, servicing, or repairing activities. Approximately 29% of the employees had "fair" or "poor" job skills when they first started the job. Employees who had been trained in Trade and Industrial fields tended to be less well prepared than in other fields.

In addition to the employee's entry-level job skills, the survey asked for an evaluation of entry-level technical knowledge. These results, shown in Table 3, indicate that about two-thirds (65.6%) of the students in the sample had either "good" or "very good" technical skills. Again, the students trained in the Trade and Industrial Occupations were somewhat less prepared than students in the other program areas.

The employers were asked (Item 3) to list additional job skills and technical knowledge that would have been desirable for the employee to possess when first hired. A total of 107 comments were offered by employers. These data, shown in Table 4, indicate that the greatest need seems to be for better technical training. The second most frequent recommendation was for better academic training. General comments that could not be coded appear for each program area and for each school in Appendix B.

The evaluation of the employee's basic skills is reported in Table 5. Employers tended to be very satisfied with the abilities of the employees, trained in career education, to read, communicate, and perform computations. Nearly 80% of the employees were judged to have "good" or "very good" basic skills.

In summary, the employers indicated that the general or basic education of the career education students was good. However, the employers tended to be a little less satisfied with the technical

training and job skills abilities of selected employees when they were first hired.

C. Characteristics of Employees at the Present Time

employers to evaluate the current abilities and activities of employees in the sample. If a particular employee had terminated prior to the survey, the employer was asked to evaluate the employee's abilities and activities prior to leaving the firm.

The evaluation of the quality of the employee's work (1tem 5) is reported in Table 6. Over 80% of the employees were judged to produce 'good' or "very good" work.

Table 7. Overall, 73.8% of the employees were judged to produce a "good" or "very good" quantity of work. About 43.7% of the employees in Trade and Industrial Occupations were considered to produce a "fair" or "poor" quantity of work. Employers of students trained in Merged Area V were significantly more satisfied with the quantity of work of their employees than was true of employers from the other two merged areas.

The employees' current job skills (Item 7) were evaluated and are reported in Table 8. The responses of Table 2 provide an evaluation of the employees' job skills when first hired. At the time the students were hired only 69.1% were perceived to have "good" or "very good" job skills. In contrast, after working on the job for a period of time, 80.2% of the students were perceived to have "good" or "very good" job skills.

Apparently, employers feel that on-the-job experience provides valuable

assistance in developing good job skills, and, therefore, they are satisfied with the abilities of the employees.

Employers were also asked to evaluate the employees' current technical knowledge (Item 8), as well as the technical knowledge when hired (Item 2). At the time employees were hired 65.6% were thought to have "good" or "very good" technical knowledge. But after working for a time, a total of 76:6% (see Table 9) were rated to have "good" or "very good" technical knowledge. Again, it seems that employers feel that a fair amount of technical knowledge is acquired on the job. Employees from Distributive Education and Health Education programs were perceived to have better technical knowledge that the employees included in the sample from the other educational programs.

The employees also we're evaluated on work attendance. The results shown in Table 10 indicate good overall work attendance. Only 15.7% of the employees were perceived to have "fair" or "poor" attendance habits. Employees from the Health Educations were perceived to have significantly weaker work attendance habits than the other occupations. A total of 23.5% of the Health Education students were evaluated to have "fair" or "poor" work attendance patterns. (This may be due to the contact with patients who are ill and infect the employees.)

habits. The responses to Item 10 are shown in Table 11. The data indicate that, 85.4% of the employees were judged to be "good" or "very good" in punctuality. Employees in the Health Education, Office Occupations, and Trade and Industrial Occupations programs were less punctual than employees in other occupations.

Item 11 of the questionnaire asked employers to evaluate the employees' compliance with company policies, rules, and practices. The

data shown in Table 12 indicate the 82.1% of the employees were judged to be "good" or "very good" in their behavior toward policies, rules, and practices.

In Item 12 employers were asked to evaluate the employees willingness to accept responsibility. The results shown in Table 13 indicate that just over 69% of the employees indicate such a willingness.

Employees in Distributive Education were much more willing to accept responsibility than employees in other programs.

The data in Table 14 indicate that only 66% of the employees were perceived to be able to work with minimal supervision. Again, a greater percentage of employees in Office Occupations and Trade and Industrial Occupations were considered to need supervision than was true in the other program areas.

The employees also were evaluated with regard to their cooperation with co-workers. These results (Item 14) are shown in Table 15. In general, 85.1% of the employees were considered "good" or "very good" in their cooperation with other employees. A significantly greater percentage of employees from Agriculture were viewed as uncooperative than was true of the other program fields.

Almost 80% of the employees in the sample were perceived as being cooperative with management. These results are shown in Table 16. The employees in Trade and Industrial Occupations and Agriculture were viewed as being somewhat less cooperative than employees from other program fields.

Tables 17A, 17B, 18A, and 18B tally the coded open-ended responses to Items 16 and 17 of the questionnaire. These two items asked the employers to report specific strengths, weaknesses, and other comments

-8

regarding the employees in the sample. Tables 17 and 18 do not include general comments that did not apply to a specific employee. In general, the employers did not seem to be disappointed with the social, communicative, computational, or reading skills of this sample of employees trained in career education programs.

III. SUMMARY AND RECOMMENDATIONS

During 1976, the State Department of Public Instruction appointed Dr. Kenneth Wold to coordinate a pilot survey of employers of former students trained in preparatory career education programs in Areas IV, V, and XI of the State of Iowa. The Department of Public Instruction awarded a contract to the American College Testing Program to collect and report the results of this pilot survey. The actual administration of the survey interviews occurred from January 20, 1977, to March 10, 1977.

Data were collected for 252 of the 300 identified students. This represents a collection rate of 84%. The most popular reason for not being able to collect employer evaluations were:

- A. Employer out-of-business and/or cannot locate responsible person
- B. No record of employee having worked for employer.

If a statewide survey of employers of career education graduates were conducted, it is anticipated that data for about 84% of the graduates could be collected. This response rate may be higher if the survey is conducted within six months to a year after the names of employers are provided by former students.

The completed questionnaires were analyzed by education program, school, and merged area. In addition, analyses were reported by educational-taxonomy number within each school and are provided in Appendix D.

A total of 47.6% of, the employees were still working for the same employer in the Winter of 1976 as they had earlier identified as their employer in the Spring of 1975. Only 4.8% of the employees had been discharged. A large percentage of the employees had quit voluntarily. Again, if a statewide survey were to be administered shortly after the names of employers are provided by former students, the percentage of students still employed by the same firm would be considerably greater than 47.6%.

The data from the pilot survey indicate that employers were generally pleased with the abilities of the employees when first hired. Over two-thirds of the employees were evaluated to have "very good" or "good" job skills and technical knowledge. However, several comments made by the employers for Item 3 indicated that they would like these employees to have had more technical training.

The survey questionnaire was also designed to ask for employer evaluations of current characteristics of the employees. The data indicated that employers were remerally satisfied with the quality and quantity of the employees work. Job skills, technical knowledge, work attendance, punctuality, and compliance were also perceived to be satisfactory. Employers showed concern with employees willingness to accept responsibility and their need for supervision. The great majority of employees were perceived to be cooperative with both co-workers and management.

ACT believes that the items included in the survey were easily understood by the employers. In general, the employers had little or no difficulty in completing the survey. However, it is recommended that the statewide survey be redesigned so that Questions \$\, 16\, and 17\, of

Section C be worded so that they are <u>not</u> open-ended. The response options for Questions 16 and 17 of the pilot survey were coded and are shown in Tables 17A, 17B, 18A, and 18B. General comments that could not be coded are given in Appendix B.

The pilot survey instrument did not include the employee's name; rather, a student ID number was coded on the survey questionnaire. ACT did not encounter any employer concern about treatment of the data in a confidential manner. ACT found it difficult in the administration process to exclude the employee's name on the instrument. Since employers showed no concern, it is recommended that employee's name be included on the instrument used for the statewide survey.

The pilot survey instrument asked for job title of the employee.

ACT found some of these titles difficult to categorize and code.

Therefore, it is recommended that the statewide survey request "job description" in addition to "job title" if the field is to be coded. It would also be helpful to have a short description of the employer's business. This may be helpful in assigning proper job title codes.

Overall, the survey was administered and analyzed according to plans. If a statewide survey is conducted, similar procedures could be followed to collect and analyze the data.

IOWA EMPLOYERS SURVEY QUESTIONNAIRE

Iowa Employers Survey Questionnaire

WINTER 1976-77

To the Employer:

The lowa Department of Public Instruction is interested in obtaining your evaluation of employees who received vocational, technical training at selected high schools and area community colleges. This questionnaire is designed to collect an evaluation of the employee when hired and a current evaluation.

Your responses will be combined with responses from other-employers to report the results. Information regarding any single employee will not be identified in any way.

Thank you for your cooperation.

-ROBERT D. BENTON, Ed.D., STATE SUPERINTENDENT

a place to grow

January 1977

Dear Şir:

The American College Testing Program (ACT) has been retained by the Iowa Department of Public Instruction to survey a sample of firms which employ persons who participated in vocational education programs during school year 1973-1974. Where several of these individuals have been or are employed by one firm, a sample of these workers will be included in the survey. The purpose of this study is to ascertain the strengths and weaknesses of the vocational education programs offered by selected high schools and area schools or community colleges in Iowa. This is not an attempt to evaluate individual workers.

A representative from ACT will call you in a few days to see if your organization will be able to assist us in this important project. If you can participate, the representative will need to arrange an appointment for a short interview with the supervisor of each of the employees included in the sample. The interviewer will try to arrange times that are the most convenient for your staff.

In the process of conducting the survey and reporting the findings, all effort will be made to maintain confidentiality relative to individual firms and employees included in the survey.

We shall be most appreciative if you can help with this important study.

Sincerely,⁴

Dr. Robert D. Benton

State Superintendent

Department of Public Instruction

Dr. James Maxey

Assistant Vice President

American College Testing Program
